Snmp Card With Remote Control and Management

SNMP refers to the Simple Network Management Protocol, and its full name in English is "Simple Network Management Protocol". This is the most commonly used computer network management protocol, and it is also the Internet-oriented management protocol proposed by the Internet Engineering Task Force ietf.

SNMP has the following technical advantages:

Automated network management. Fewer packet types, simple packet format, easy to parse, and easy to implement. Based on the standard protocol of TCP/IP Internet, the transport layer protocol generally adopts UDP. Simple request-response method and active announcement method are combined, and there are timeout and retransmission mechanisms.

Shield the physical differences of different devices to realize automatic management of products from different manufacturers. SNMP only provides the most basic set of functions, making management tasks relatively independent of the physical characteristics of the managed devices and the actual network type, so as to realize the management of devices from different manufacturers.
